OBD Fault Simulation? – This is your Tool!

THE TOOL FOR INJECTOR COMMAND AND SIGNAL MANIPULATION

One of the most demanding challenges in on-board diagnostics is the introduction of complex direct injector faults. Using Sohatex OBD-FIT, fuel trim and closure waveform deformation are just a mouse-click away.

OBD-FIT is a tool for homologation tests in the automotive industry and was developed by a team of combustion engine specialists and software developers to bring you the optimal mix of functionality and ease of use. As such it allows you to check a wide variety of fuel system related OBD functions - specifically tailored to the US CARB requirements.

◀ Though OBD-FIT offers a pocket knife of tools and utilities for direct injection fault insertion, it still remains in a small form factor and is fully stackable to be equally applicable for engines with one or twenty injectors simultaneously.
